# A novel generalization about headedness and pronouns

*Kenyon Branan*

First, I present a generalization: that head-final languages do not have weak pronouns. Then, I discuss the results of a typological survey (in progress) that back up this generalization, and note how these results may require us to be a bit more specific about what it means to be a "head-final language", and how we should think of weak pronouns. Finally, I present a Contiguity-theoretic analysis that allows us to understand why head-final languages should lack weak pronouns, and discuss implications and avenues for future work.
