

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

CRC 990

First (!) status report

Stefan Scheu
Speaker

Idea of CRC 990

Establish knowledge on ecological and socioeconomic functions and trade-offs

to

protect and enhance
ecological functions and human welfare

→ *Collaboration between and integration of natural and socioeconomic sciences*

→ *Reconciling conservation and human needs*

Binational cooperation on basic research and higher education

➤ Main cooperation partners

- Bogor Agricultural University (IPB)
- Jambi University (UNJA)
- Tadulako University Palu (UNTAD)

➤ Main research output

- Basic science knowledge
- Publications

➤ Main dates

- Start of project January 2012
- Kickoff meeting June 2012
- Start of field work August 2012
- End of (current) funding December 2015
- Potential of funding until 2023

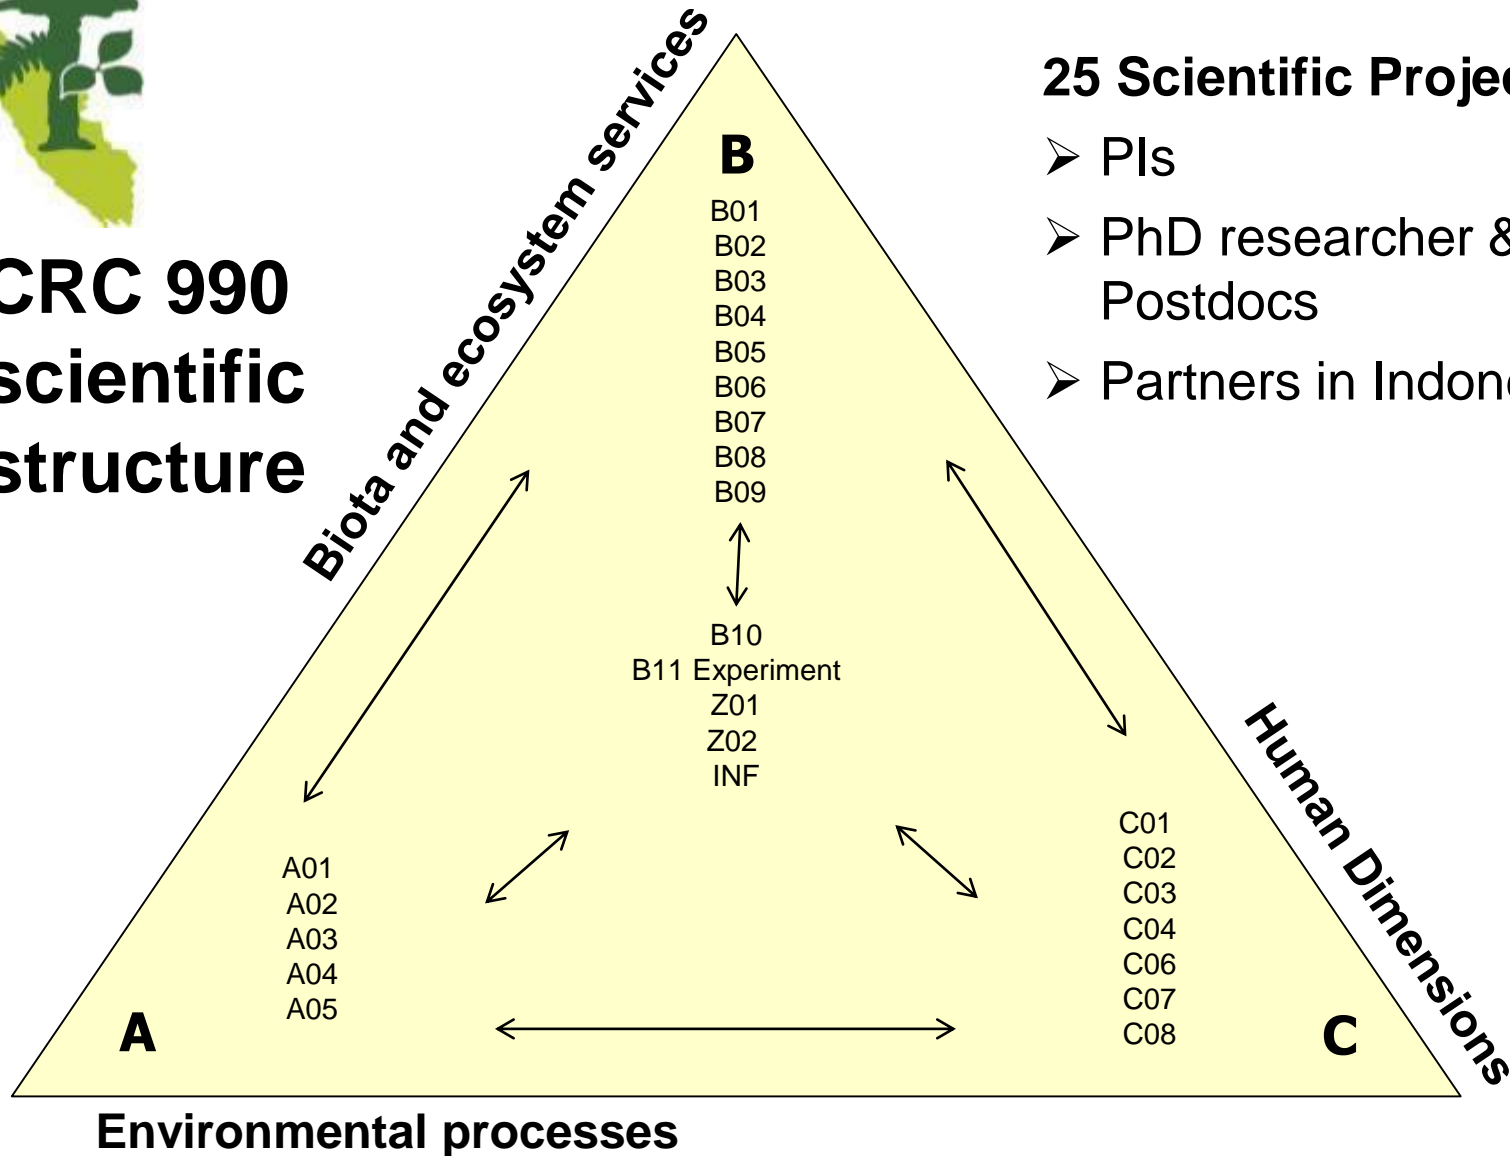

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

CRC 990 scientific structure

25 Scientific Projects:

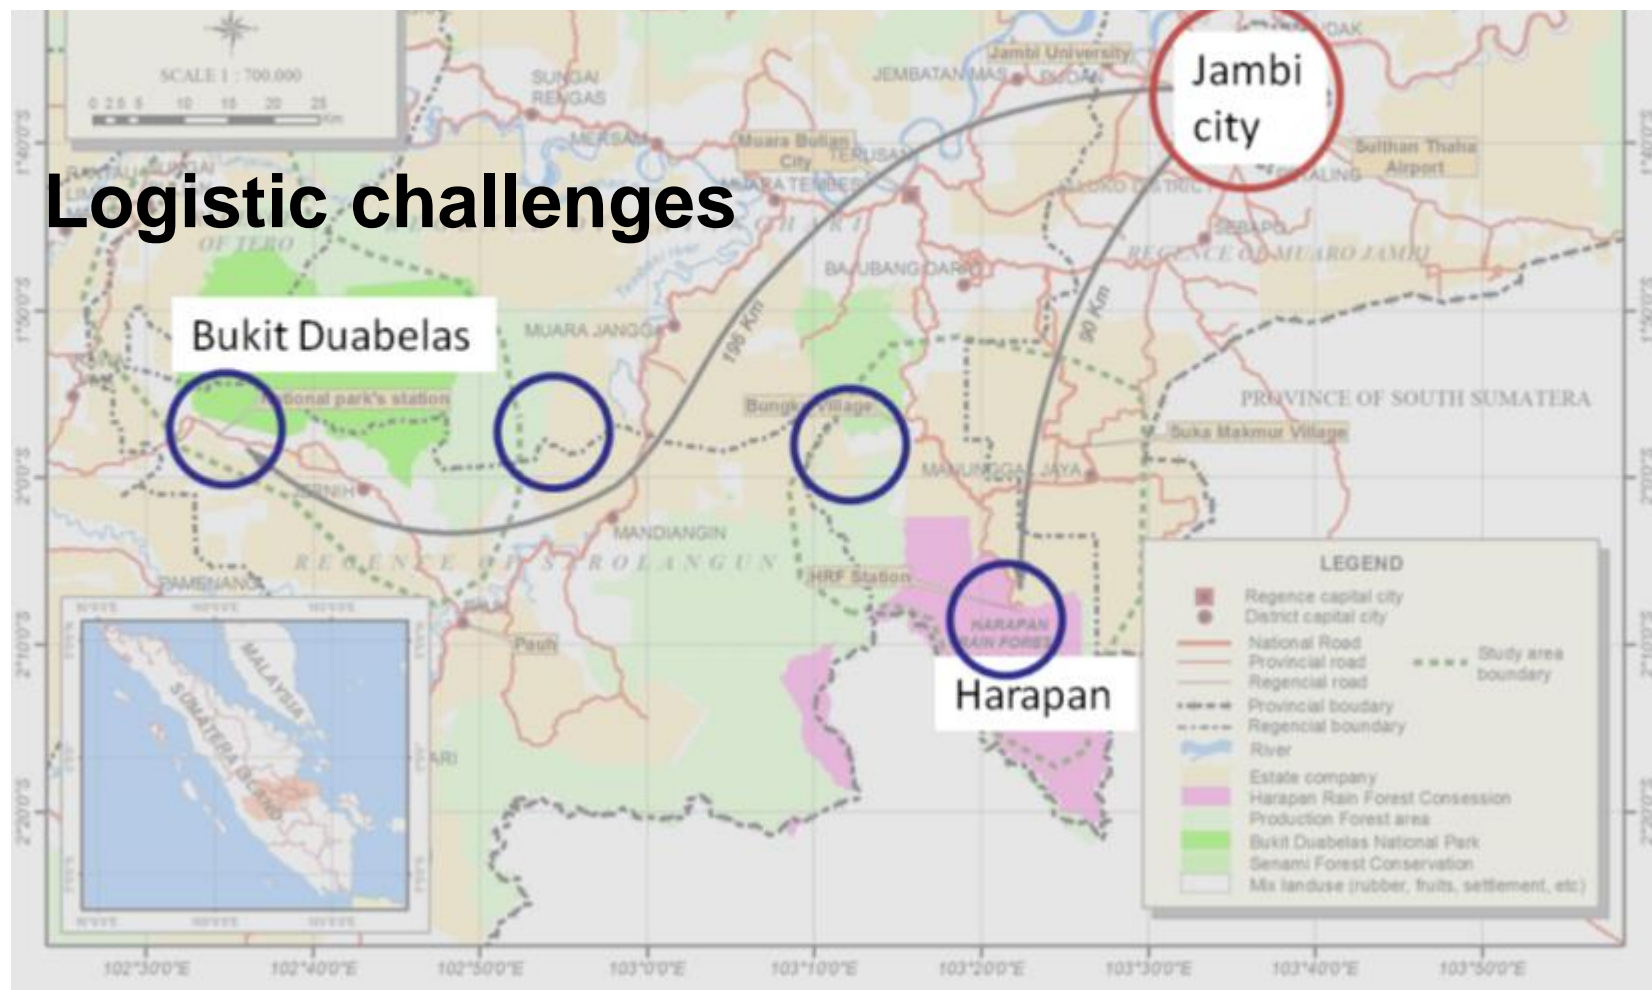

- PIs
- PhD researcher & Postdocs
- Partners in Indonesia

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

- 1 core station: logistic basis with office, staff, accommodation, cars ...
- 4 field hubs: basic infrastructure accommodation, electricity, motorcycles ...

Logistic challenges

Z01 Status update

Z02 Status update

**Monitoring of
meteorological data**

**Monitoring canopy
arthropod biodiversity**

**Barcoding
vascular plants**

Z02 (CSSU)

**Implementation
of ABS measures**

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

Z02: Monitoring meteorological data

Team: A. Knohl, O. Panverov, A. Meijide, M. Tölle, A. Rauf, P. Irianto, H. Junedi, D. Gunawan

Aim: Provide meteorological data from study sites

Status

- Meteo stations at core sites installed and running since June/July 2013
 - Air temperature, relative humidity, soil temperature, soil moisture (hourly measurements)
- Meteo stations at reference sites and UNJA running since May/June 2013
 - Wind speed, wind direction, net radiation, PAR, short wave radiation, air temperature, relative humidity, soil moisture, soil temperature, rainfall, air pressure, soil heat flux (every 10 min.)
- Data available for all CRC 990 members
 - Preparation of automatic check for data quality
 - Data available through INF project, currently on request

Core site

Reference site

Z02 - Monitoring canopy arthropod diversity

Team: S. Scheu, J. Drescher, D. Buchori, B. Irawan, R. Ubaidilah

Aim: Provide overall diversity data on canopy arthropods

Bulk of life in forests systems in the canopy

Z02 - Monitoring canopy arthropod diversity

16 traps/replicate

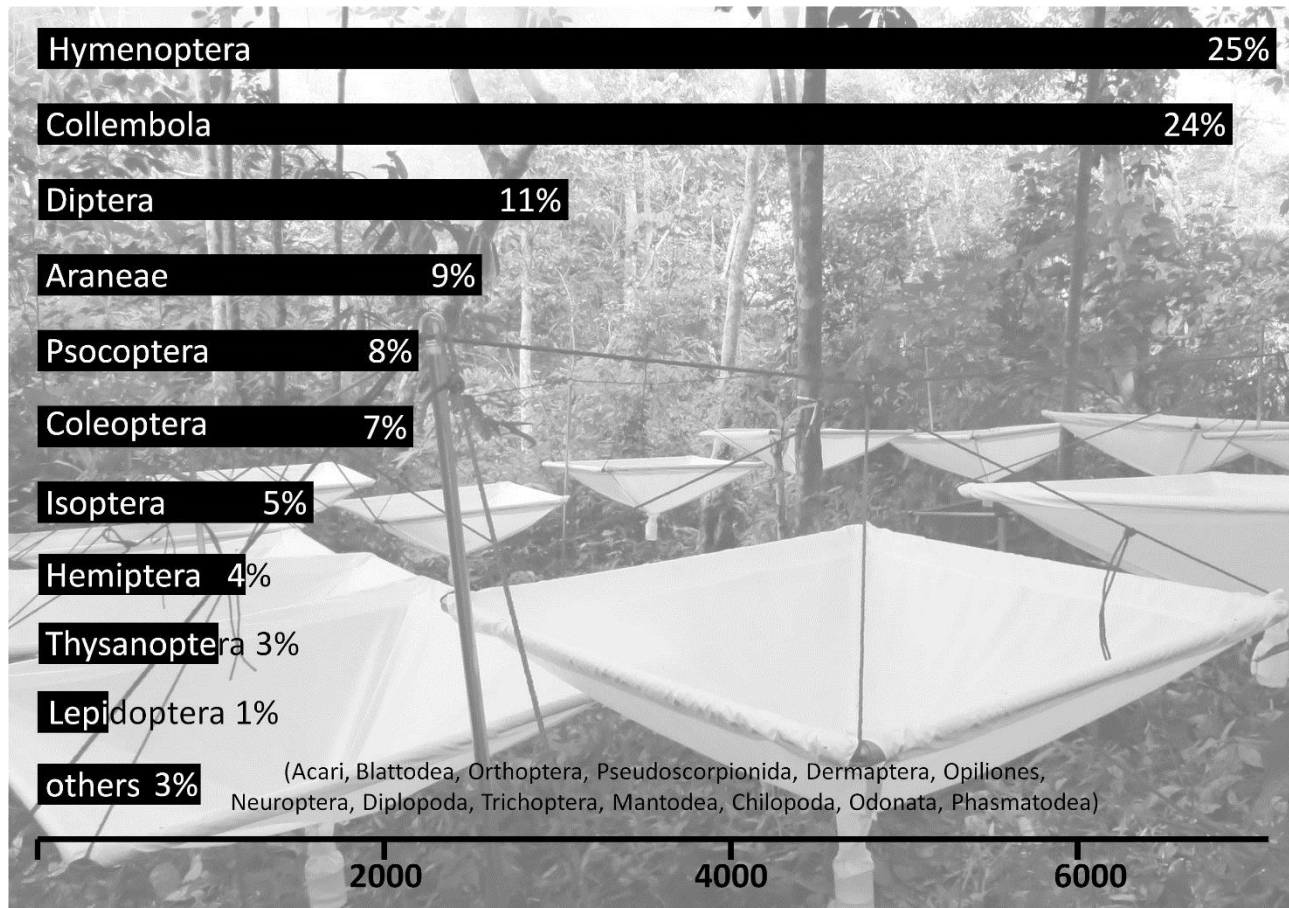

Canopy fogging

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

Z02 - Monitoring canopy arthropod diversity

Specimens of 6 plots identified to order level, N=27.275

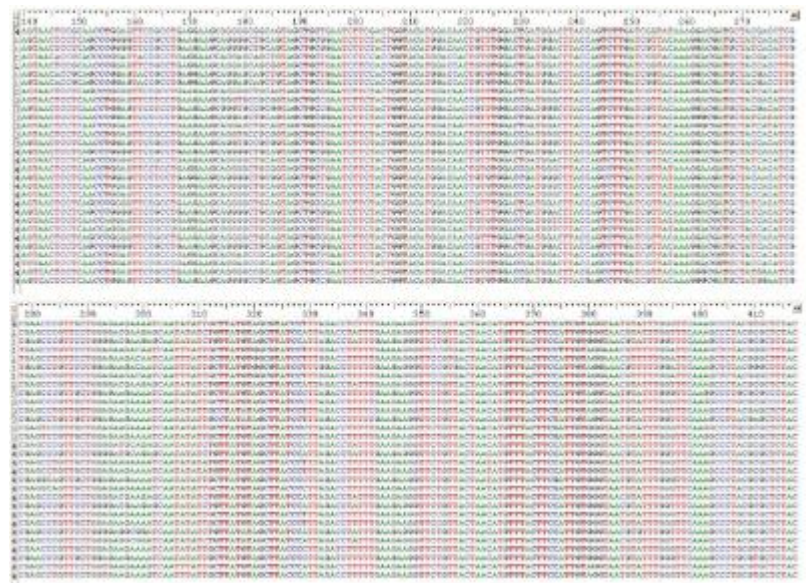

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

Z02 – Barcoding of vascular plants

Team: R. Finkeldey, H. Kreft, I.Z. Siregar, S. Rahayu, F.Y. Amandita, K. Rembold, B. Vornam

Aim: Provide tools for genetically identify plant species

Identification

Barcoding

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

Z02 – Barcoding of vascular plants

Current status

Field work

- >1.600 leaf samples collected

Laboratory work

- DNA extraction from 292 leaf samples (189 species)
 - rbcL successful rate high (>99%)
 - matK successful rate lower (>84%)

Group A : Environmental processes

Aim: To investigate the effects of land transformations on environmental processes in soil, water and atmosphere at multiple spatial and temporal scales

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

A04 - Soil carbon

Team: Y. Kuzyakov, K. Murti laksono, M. Damris, T. Guillaume

C_{org} and N_{org} (%) in A horizon

- Significant effect of land use on C_{org} and N_{org} in top soil
- C and N (%) of topsoil significantly decrease with land use intensity

A03 - CO₂ fluxes of oil palm plantation

Team: A. Knohl, O. Panferov, T. June, Irianto, H. Junedi, A. Rauf, D. Gunawan, M. Herbst, A. Meijde, M. Tölle

- Young oil palm plantation (2 years) is a moderate C sink of about 2.5 g C m⁻² day⁻¹ for CO₂ in July and August.

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

A02 - Water use

Team: D. Hölscher, H. Agusta, Hendrianto, H. Junedi, A. Roell, A. Hanf, N. Furong, A. Hardanto

Four systems, stand level transpiration (normalized, 50 days)

Oil palm, stand level transpiration (normalized) over age

- High temporal variation and high maximum values in forest and jungle rubber
- High variation at the landscape level in oil palm due to age class structure

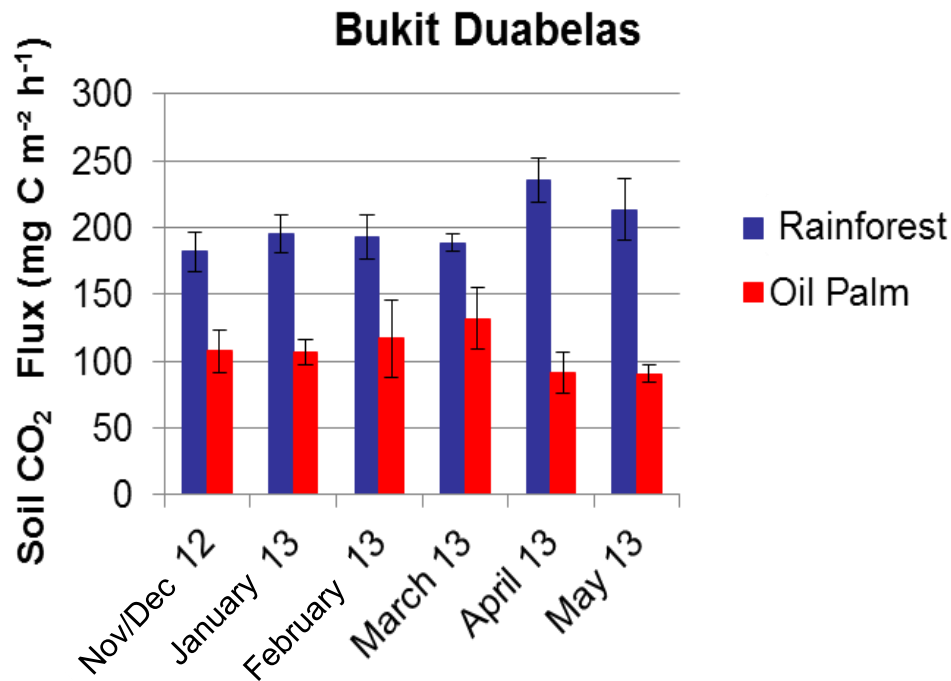

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

A05 - Soil trace gas fluxes

Team: M.D. Corre, E. Veldkamp, S.R. Utami, A. Tjoa, M. Damris, I. Rusmana, K. Allen, E. Preuß, S. Kurniawan

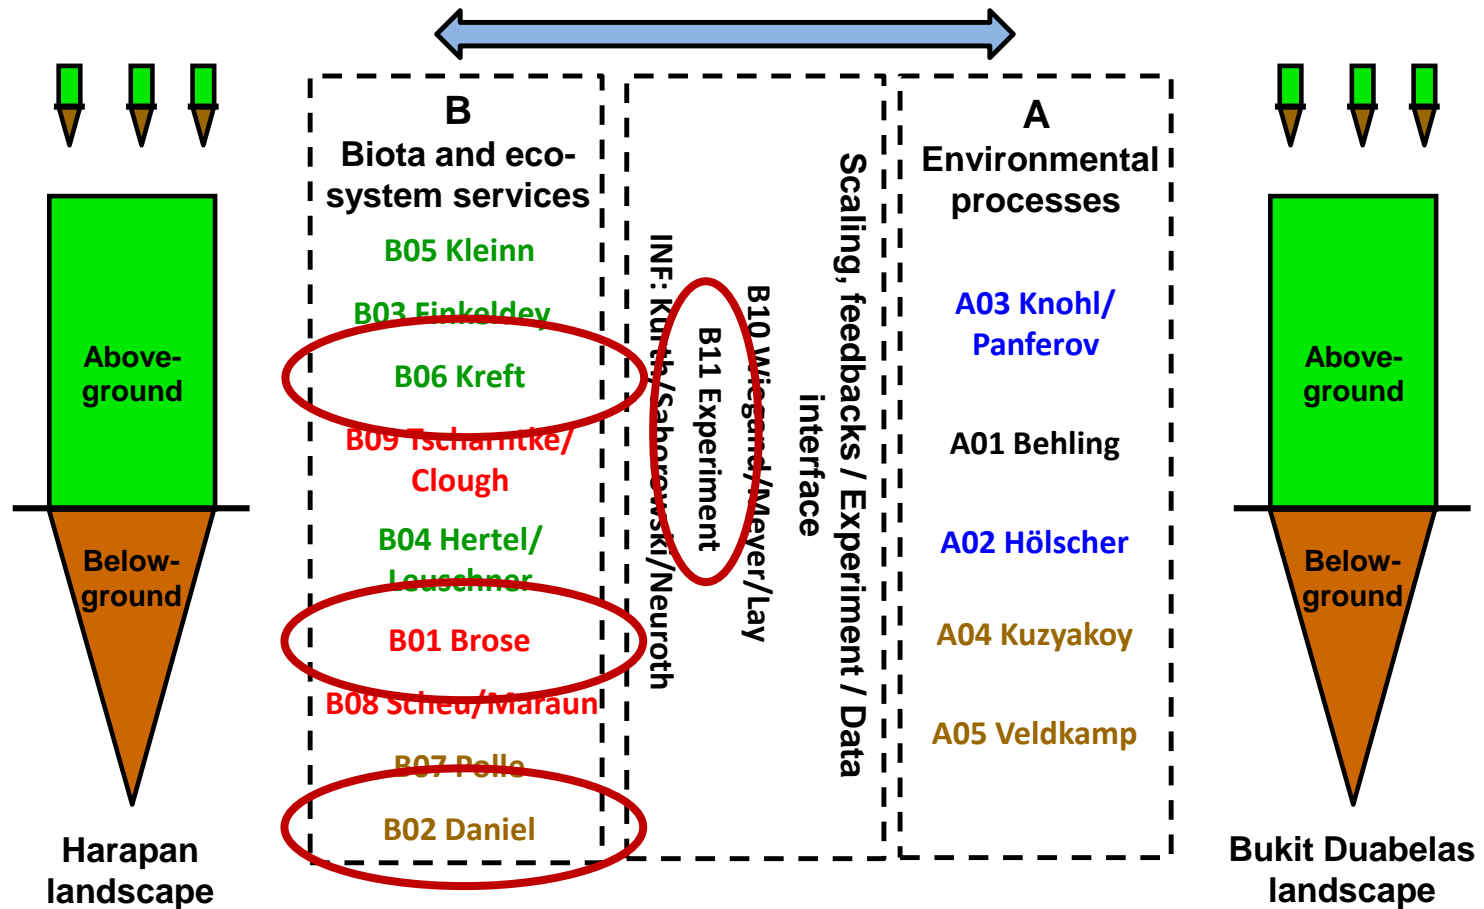

- Small seasonal variation in soil CO₂ efflux rates
- Smaller soil CO₂ efflux rates in oil palm compared to forest

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

B – Biota and ecosystem services

B02 - Metagenomic and metatranscriptomic analysis soil microbial communities

Lowland rainforest

Jungle rubber

Rubber plantation

Oil palm plantation

Isolation of soil DNA

Isolation of soil RNA

Creation of DNA libraries/
Direct PCR

16S rRNA gene analysis
(Bacteria-Archaea)

Generation of cDNA
(mRNA and rRNA analysis)

Screening and detection
of functions (N cycle)

Phylogenetic diversity of
the entire community

Functional diversity/
diversity active community

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

B02 - Metagenomic and metatranscriptomic analysis soil microbial communities

Team: R. Daniel, N. Mubarik, A. Meryandini, M. Engelhaupt

Relative abundance of soil bacterial phyla and classes in the different land use systems (analysis based on 500,000 16S rRNA gene sequences)

B01 - Structure, stability and functioning of macro-invertebrate communities

Team: U. Brose, A. Farajallah, T.H. Widarto, N.F. Haneda, A. Barnes, M. Jochum

Current status

- Animal sampling of all 32 plots completed
- Animals sorted into major groups and morphospecies
- Stable isotope and stoichiometry analyses – export permit not yet granted → food-web analyses delayed

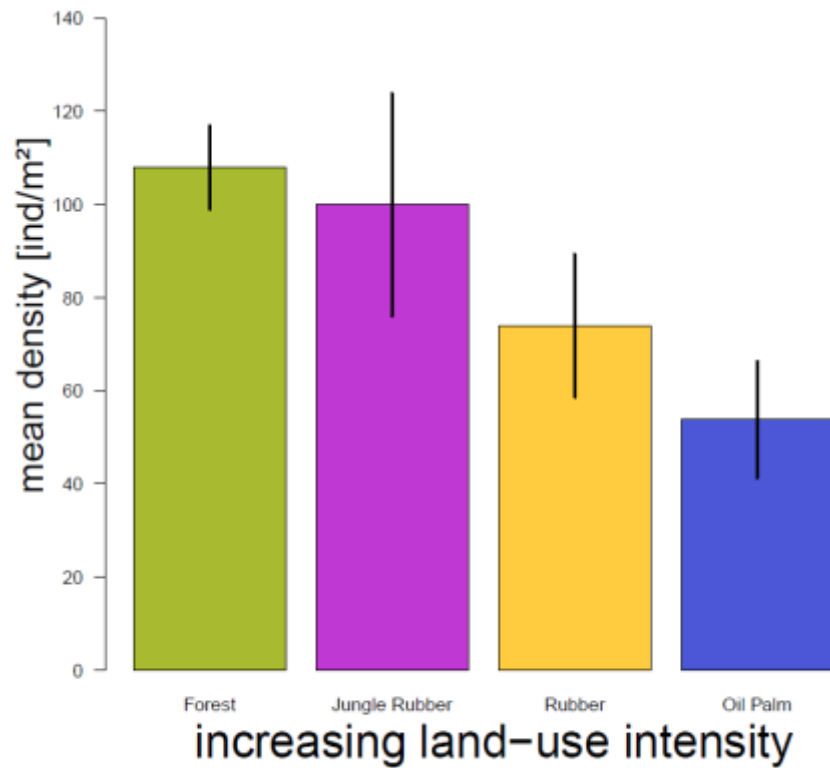

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

B01 - Structure, stability and functioning of macro-invertebrate communities

8058 individuals from 925 morphospecies (30 orders, 187 families)

B06 – Plant diversity

Team: H. Kreft, S.S. Tjitrosoedirdjo, B. Haryadi, J.C. Sulistiangsih, K. Rembold

Current status

- ~1800 herbarium specimen of ~625 species collected for identification
- Trees of BR1-4, BO2-4, BF3-4 measured (structure & position)
- Plants of subplots BR1-4, BO2-4, BF3-4 counted and measured (height)
- ~20.000 plant pictures for online identification and field guides

Inventorying of all plots to be completed in August 2014

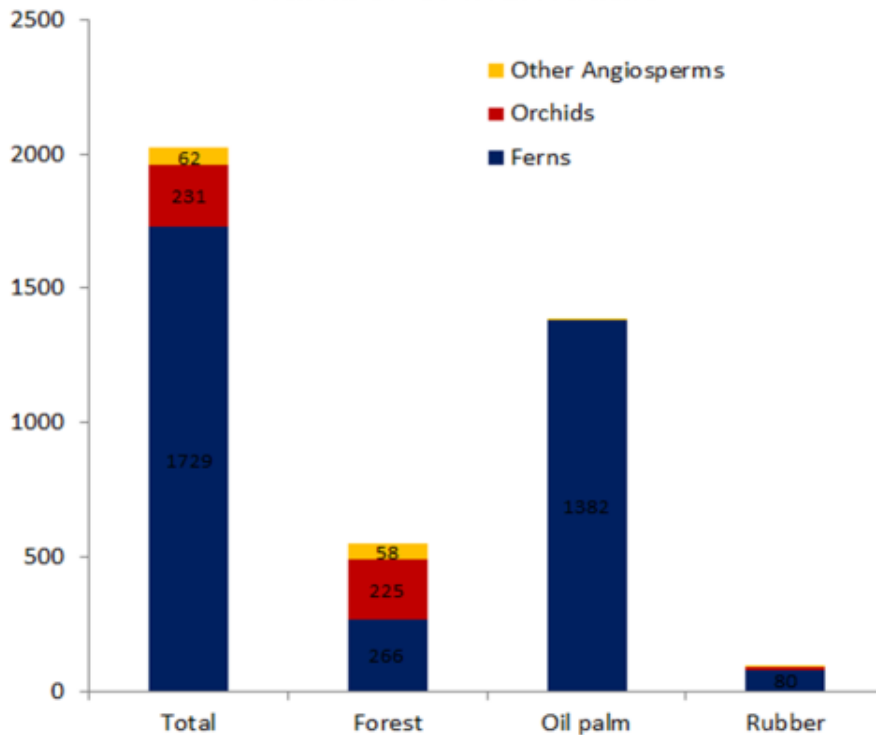

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

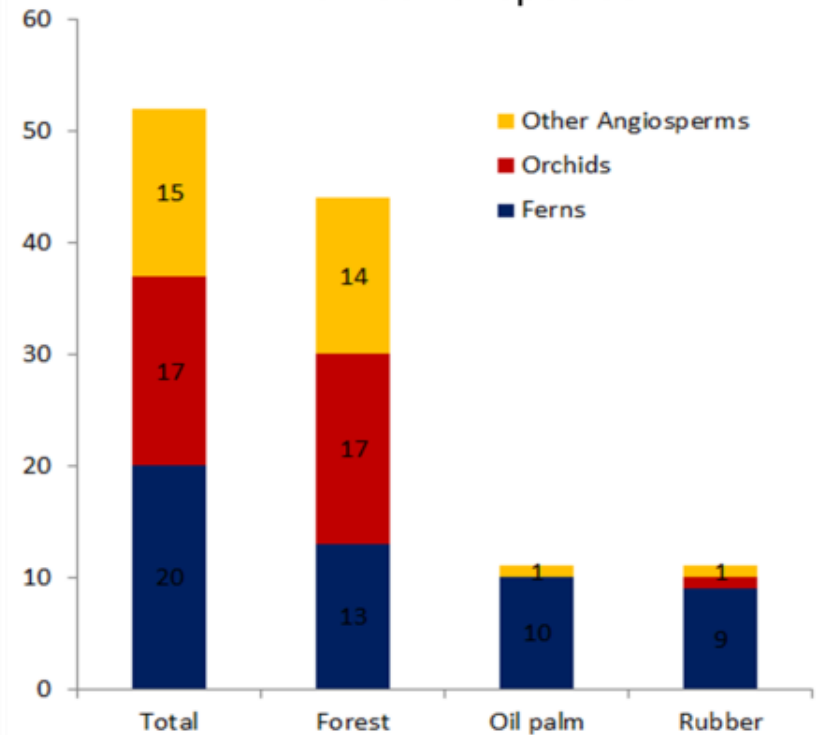

B06 – Plant diversity

Epiphytes

Number of individuals

Number of species

➤ Epiphyte abundance is high but diversity is low in oil palm plantations

B11 - Biodiversity enrichment in oil palm plantations: ecological and socio-economic impacts

Team: H. Kreft, U. Brose, D. Hölscher, Y. Clough, M. Wollni, Hendrayanto, L. Sundawati, P. Pamoengkas, B. Irawan, Rosyani, A. Tjoa, M. Treuscher, A. Gerard, M. Vorläufer

Objectives

- To increase the biodiversity within an oil palm plantation by planting “tree islands”
- To find out how enrichment planting affects
 - ecosystem functioning
 - plant & animal diversity
 - the productivity of oil palms

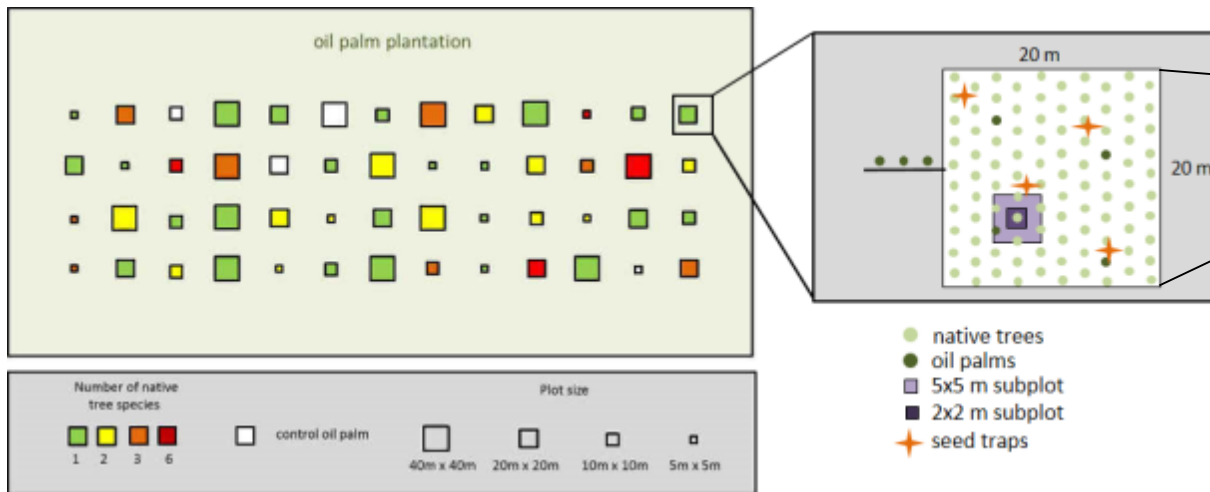

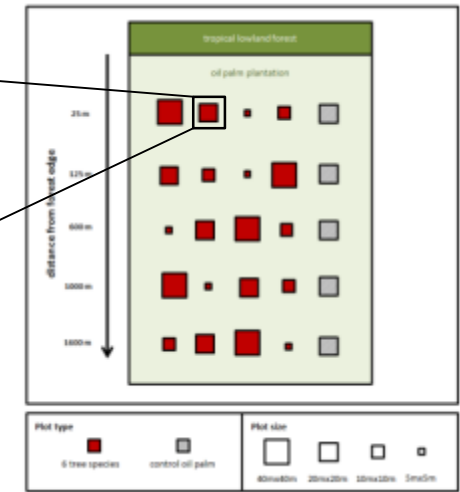

CRC 990 "Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)"

B11 - Biodiversity enrichment in oil palm plantations ...

PT Humusindo

PTPN VI

Variation of **plot size** and **species diversity level**

- Number of plots: 52
- Plot sizes: 40 x 40 m → 5 x 5 m
- Species diversity levels: 1, 2, 3, 6

Variation of **plot size** and **distance to forest**

- Number of plots: 25
- Plot sizes: 40 x 40 m → 5 x 5 m
- 6 species per plot

Group C: Human dimension

Team: B. Brümmer, C. Dittrich, H. Faust, B. Hauser-Schäublin, M. Ibanez, S. Klasen, J. Lay, O. Mußhoff, M. Qaim, M. Wollni, S. Adiwibowo, Z. Alamsyah, E. Amzu, D. Denmar, N. Dompok, Z. Fathoni, B. Juanda, D.B. Hakim, M. Mappatoba, N. Nuryartono, R. Oktaviani, Rosyani, H. Siregar, E. Soetarto, T. Sumarti, D. Surhajito, Y. Syaukat, B. Beckert, M. Euler, M. Gatto, J. Hein, A.M. Holtkamp, T. Kopp, V. Krishna, I. Kunz, S. Moser, S. Steinebach, K. Trapp, M. Vorläufer

Overarching questions

1. **Driving forces:** What are socioeconomic determinants of observed land use changes?
2. **Impacts:** What are socioeconomic impacts and trade-offs of different land use systems?
3. **Policy implications:** How can more sustainable land use systems be designed and implemented?

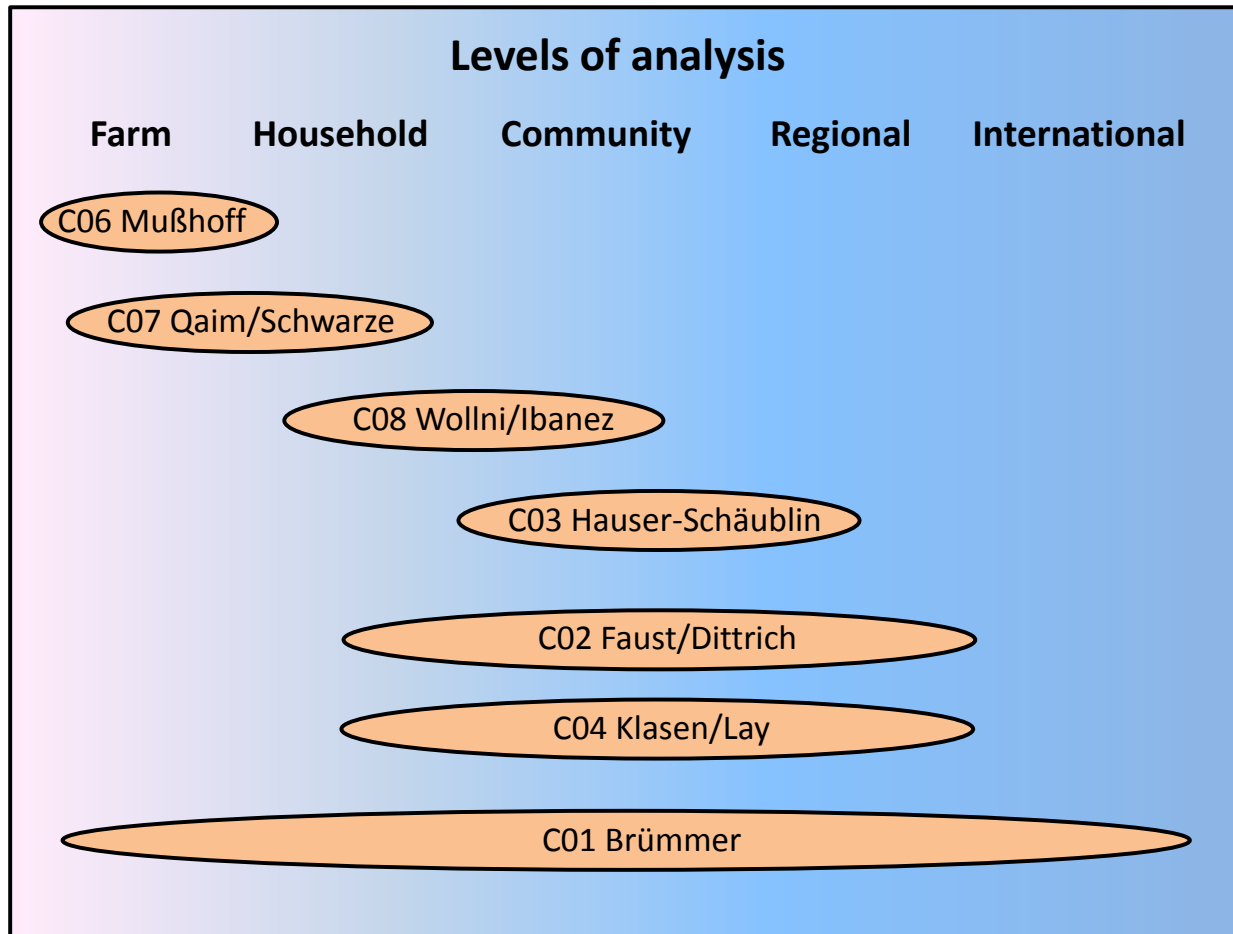

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

Group C: Human dimension

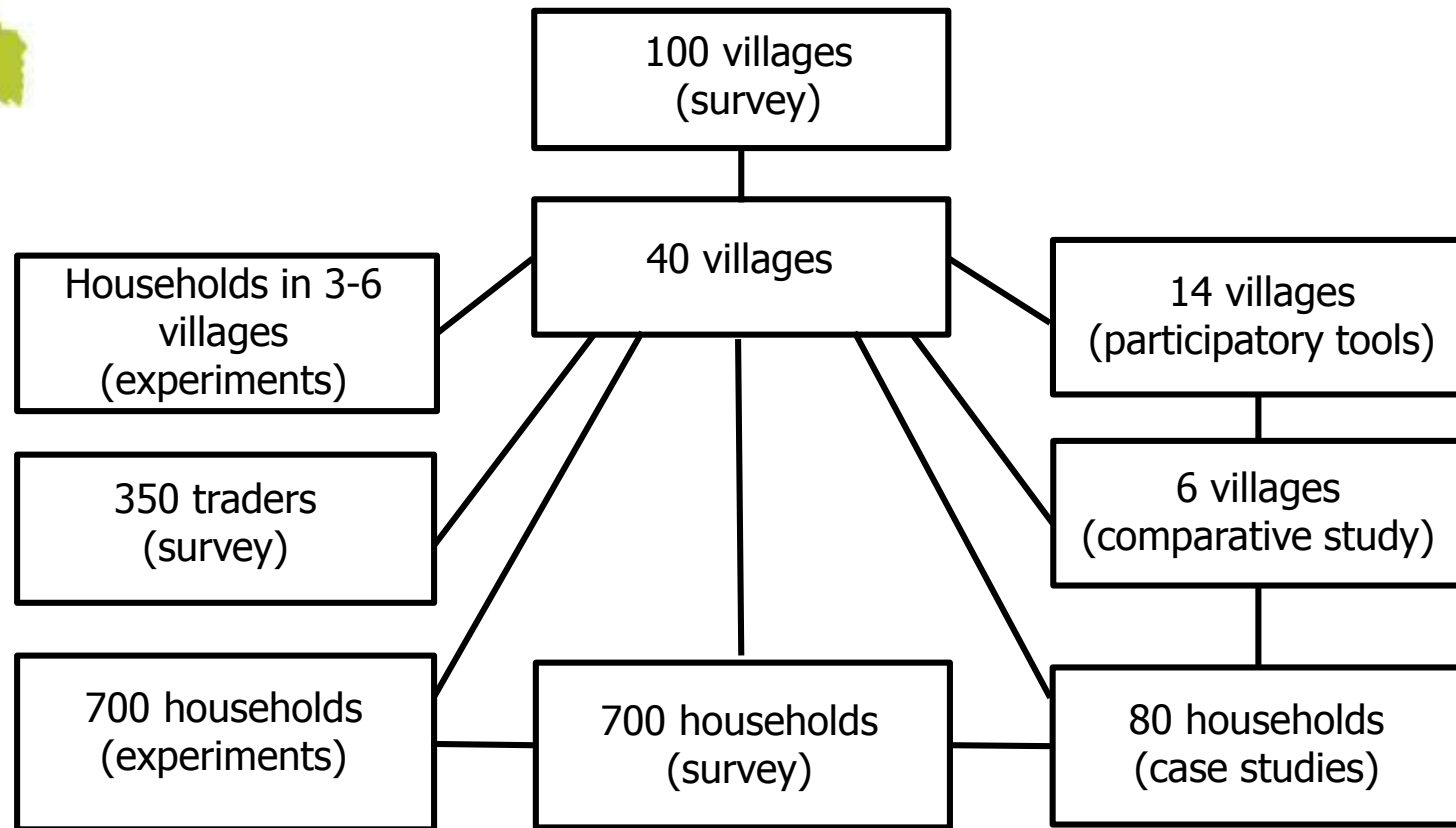

Structure of projects

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

Joint sampling framework

- Integrative approach combining surveys, experiments and case studies
- International level: Stakeholder interviews

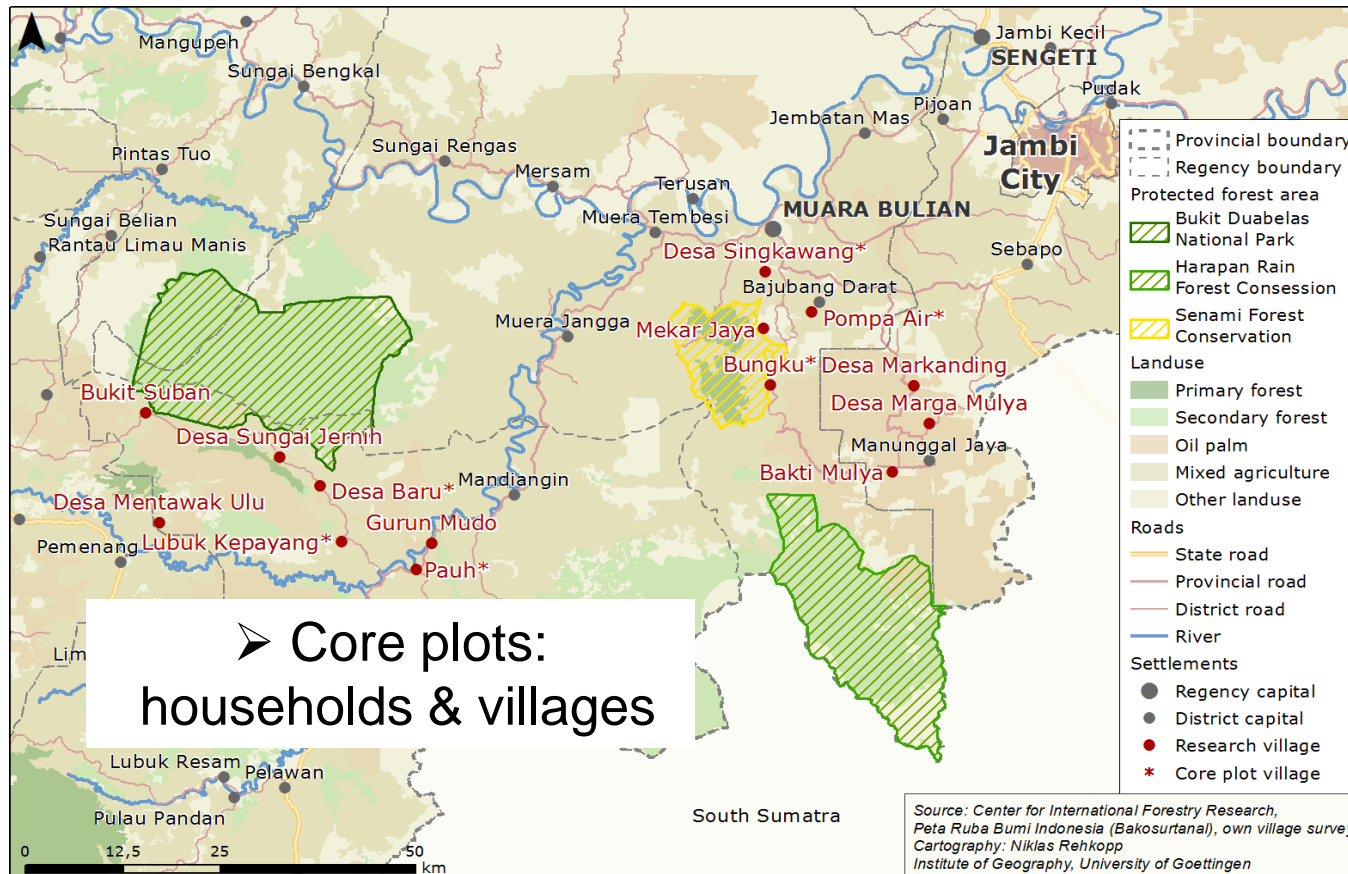

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

Group C: Human dimension

Hierarchical sampling design: Household → region

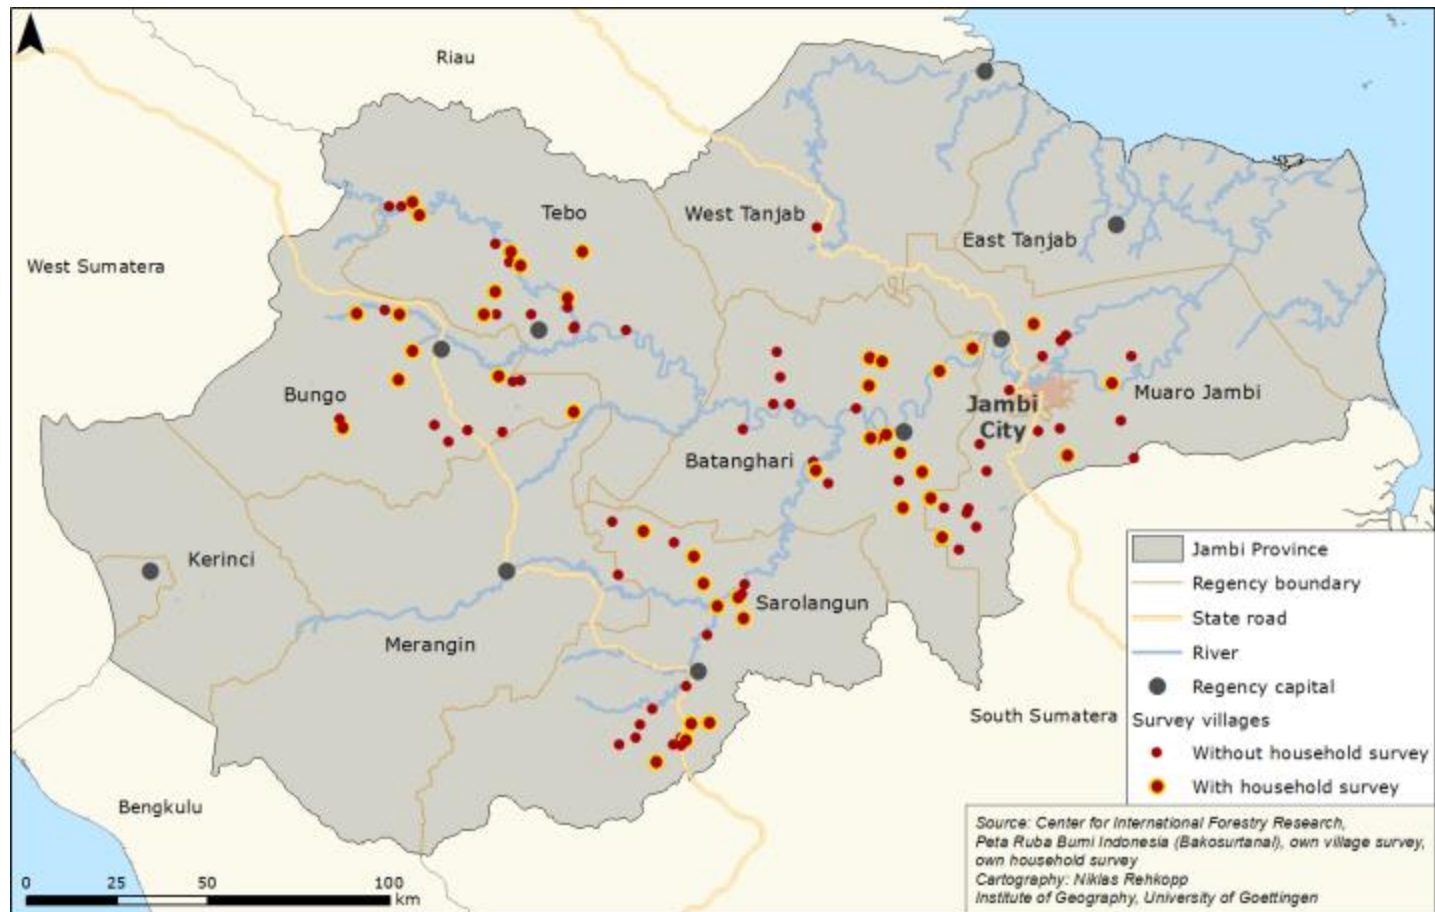

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

Group C: Human dimension

Extended data collection: Household, village and trader surveys

CRC 990 “Ecological and socioeconomic functions of tropical lowland rainforest transformation systems (Sumatra, Indonesia)”

Group C: Human dimension

First results from case studies

- Large scale development interventions like the initially World Bank supported transmigrant schemes are the main causes for cultural landscape transformation
- **In all transmigrant villages investigated, co-operations with private companies determined land use change from diverse land use towards monoculture**
- Basically since the reform era (1999) the former transmigrant projects are replaced by so called spontaneous migration originating from other areas of Sumatra
- **Surprisingly different forms of cultural knowledge and practices or ethnicity are not decisive factors with regard to the nature of land use**
- **The difficulty of gaining access to land bridges cultural and religious differences and leads to new alliances and strategies**, that range from strategic marriages of immigrants with indigenous people and the reselling of undocumented land plots, to occupation of concession land.
- The struggle to gain access to land and have customary land rights acknowledged by the state has given rise to local conflicts.

Group C: Human dimension

First results from surveys

- Currently, about 36% of farmer households in the study area are found cultivating oil palm and 82% cultivating rubber. Food crop production (e. g., rice) is carried out only in a marginal scale.
- Oil palm expansion is gaining momentum in the recent years. Although the rubber plots are rarely converted into oil palm, both these crops are competing for fallow and degraded forest lands for expansion.
- **Compared to the previous decades, smallholder plantations are developed less frequently through deforestation. Land acquisition through market is increasing in recent years.**
- **Contract farming in oil palm, often associated with transmigrant programs, is not widely followed at present.**
- In the past, smallholder contracts were very complex and diverse across the study area and had mixed livelihood outcomes.
