

A1: Reimbursable and non-reimbursable costs

The CRC has to assign the costs to different categories:

- *Consumables (Verbrauchsmaterial):*
Consumables also include small devices or apparatus (), which can be used at different installations (lenses, multimeter etc.)
- *Installation parts (Einbauteile):*
The purchased part is a component of an apparatus, e.g., a gas-flow controller for a preparation chamber. For this category we also need the inventory number ("Inventarnummer" and ideally also the "Anlagen-Nr"), plus the correct name of the apparatus.
- *Devices above 1.000 Euro (Geräte über 1.000 Euro netto):*
Permission of the CRC board is required if the gross price exceeds 10.000 Euro. The CRC has to list such devices for the financial controlling on behalf of the DFG.
- *GWG (150 - 1.000 Euro):*
GWG (geringwertiges Wirtschaftsgut) means something like low-value economic product. A "GWG" is simply a device which can work alone. A loupe is a "GWG", but a lense for a laser system belongs to "Consumables".

The DFG reimburse extra costs which emerge due to the project. "Consumables" doesn't include consumptions related to the basic laboratory and office equipment like office supplies, standard gases and liquids, leasing of gas bottles. The SFB can also not pay for internal attendances ("interne Leistungsverrechnung") unless it is solely for consumables and the documentation is sufficient (please ask Antje), software, furniture, repairs and spares.

In the case of very expensive acquisitions the CRC can apply for an exceptional permission of the DFG. This requires a clear scientific substantiation. The work in the project requires a special software tool, which is not useful for other (non-)SFB projects. A special analytical technique can be only used via internal attendances.
